

Controlled Pre-stretch Unit

Film rolls are loaded by placing the roll on the film mandrel and threading the film around the pre stretch roller and onto the load. Because of the simplicity of the design, the pre stretch head is safer and faster to use.

The pre stretch rollers are machined smooth allowing for high stretch levels regardless of film thickness.

The smooth surface is less aggressive on the film allowing the consumer to achieve the desired quality of wrap using much thinner films, saving on consumable costs.

Tough Poly Urethane pre stretch rollers are guaranteed to withstand normal wear and tear for the life of the machine.

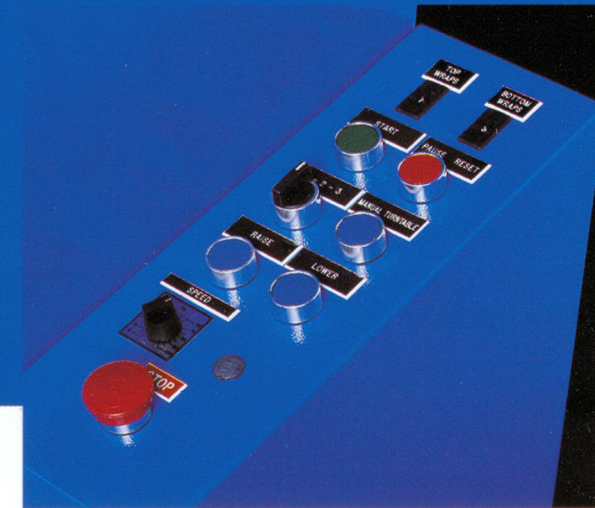

Turn-table.

Heavy duty ball turn-table bearing with a 3500 Kg capacity. Long life Vee belt drive. Belt runs on its own drive ring not on the bearing.
